Heart Health Tracker Application

Creation of an android application for tracking heart health, and making that data available for researchers.

# Team Roles and Contributions

- Jamie Starr was the sole member of the team.

Industry Problem and Domain

- There are no heart health tracking applications that make data available to researchers.

- Heart health data is difficult to find.

- A tracking application could fill both roles.

Project Final Status

- When Project 4 was completed, it became apparent that data sets for heart health were difficult to find, thus the last minute changes to the application.

Final Gantt Chart

	Week 11	Week 12	Week 13	Week 14	Week 15	Week 16
setup environments						last minute
develop android app					last minute changes	
develop restful service						last minute
test and deploy service						

Future Plans

- In the future, adding additional metrics to the heart health application. Specifically, adding outcomes like heart attack, stroke, and other cardiovascular difficulties is useful.
